## Message from General Chairs

The International Conference on Frontier Computing – Theory, Technologies, and Applications (FC) was first proposed in early 2010 on an IET executive meeting. This conference series aims at providing an open forum to reach a comprehensive understanding to the recent advances and emergence in information technology, science, and engineering, with the themes in the scope of Communication Network Technology and Applications, Business Intelligence and Knowledge Management, Web Intelligence, and any related fields that prompt the development of information technology. This will be the fourth event of the series, in which fruitful results can be found in the digital library or conference proceedings of FC 2010 (Taichung, Taiwan), FC 2012 (Xining, China), FC 2013 (Gwangju, Korea), FC2015(Bangkok, Thailand), FC2016 (Tokyo, Japan), and FC2017(Osaka, Japan).Each event brings together the researchers worldwide to have excited and fruitful discussions as well as the future collaborations.

The papers accepted for inclusion in the conference proceeding primarily cover the topics: database and data mining, networking and communications, web and internet of things, embedded system, soft computing, social network analysis, security and privacy, optics communication, and ubiquitous/pervasive computing. Many papers have shown their great academic potential and value, and in addition, indicate promising directions of research in the focused realm of this conference series. We believe that the presentations of these accepted papers will be more exciting than the papers themselves, and lead to creative and innovative applications. We hope that the attendees (and readers as well) will find these results useful and inspiring to your field of specialization and future research.

On behalf of the organizing committee, we would like to thank the members of the organizing and the program committees, the authors, and the speakers for their dedication and contributions that make this conference possible. We would like to thank and welcome all participants to Kuala Lumpur, Malaysia. Though most of countries may share some similar characteristics, you will find that culture of Malaysia is quite different from many aspects, such as art, religion, nomadic life style, food, and music. Kuala Lumpur is the capital city in Malaysia. We encourage the participants to take this chance to see and experience Southern Asia, especially the remote counties and the nomadic life style there. We also sincerely hope that all participants from overseas and from Malaysia enjoy the technical discussions at the conference, build a strong friendship, and establish ties for future collaborations.

We send our sincere appreciations to the authors for their valuable contributions and the other participants of this conference. The conference would not have been possible without their support. Thanks are also due to the many experts who contributed to making the event a success.

### **Smart Campus Construction in AI, Big Data, IoT, and Cloud Computing Era: A Case of Smart Power Saving Service**

#### **Abstract**

With the flourishing of the Internet of Things (IoT) technology, ubiquitous power data can be linked to the Internet and be analyzed for real-time monitoring requirement. Numerous power data would be accumulated to even Terabyte level as the time goes. To approach a real-time power monitoring platform on them, efficient and novel implementation techniques have been developed and formed to be the kernel material of this talk. How to reduce expenses by reducing electricity consumption, and effective energy conservation in the huge campus of electricity load, lower electricity costs and unnecessary consumption is essential. The campus building electricity information through smart meters is collected and processed a massive amount of data by Big Data processing techniques. The proposed system adopts the big data and cloud computing technologies in Hadoop because of the big data collection, data storage, and the computational efficiency of data analysis. The data collection and storage are handled by the Hadoop subsystem and the data ingestion to Hive data warehouse is conducted by the Spark unit. We proposed an architecture to import existing power data storage system of our campus into Big data platform with Data Lake. We use Apache Sqoop to transfer historical data from existing system to Apache Hive for data storage. Apache Kafka is used for making sure the integrity of streaming data and as the input source for Spark streaming that writing data to Apache HBase. To integrate the data, we use the concept of Data Lake which is based on Hive and HBase. Apache Impala and Apache Phoenix are individually used as search engines for Hive and HBase. We used Apache Spark to analyze the power consumption of the campus using analysis module of power anomaly, power consumption forecasting, and power failure analysis. The kernel contributions of this research work can be highlighted by two parts: (1) Multi-layer software modules are applied to design and implement the real-time power-monitoring platform embedded with some excellent characteristics of high efficiency, high feasibility, and low cost. (2) The rudimental experiments are conducted to verify the query-response efficiency, and performance evaluations for the proposed real-time power monitoring platform, which reveals the high feasibility of the target research goals.

## Invited Talk

**Title:** Recent research topics in computational intelligence and machine learning

**Presenter:** Yan Pei, University of Aizu, Japan

Yan Pei obtained Doctorate of Engineering from Kyushu University, Fukuoka, Japan. He received the B.Eng. degree and M.Eng. degree from Northeastern University, Shenyang, China. He is currently working at the University of Aizu, Japan, as an Associate Professor. His research interests include Computational Intelligence, Machine Learning, and Software Engineering.

**Abstract:** Computational intelligence and machine learning are two conventional research fields in artificial intelligence. One refers to the ability of natural and artificial agents to behave intelligently, and the other refers more or less to the ability of a computer program to learn from a set of inputs either in a supervised method by being actively train or unsupervised method by exploring the characteristics of raw data on its own. In this talk, we will share some new techniques in these two fields, they include: [1] Accelerating evolutionary computation using estimated convergence points; [2] Principal component selection using interactive evolutionary computation; [3] Autoencoder using kernel method; and [4] Kernel partial least squares regression by projecting both independent and dependent variables into reproducing kernel Hilbert space. Some basic knowledge will be provided and discussed in this talk as well.
